Planning (Chapter 2 from Lavalle book)

Abstraction of a planning problem

- 1. State space $s \in \mathcal{S}$. For example, 2D coordinate of a grid s = (x, y).
- 2. Action space per state $u \in \mathcal{U}(s)$. For example, up, down, left right movement can be encoded as $\mathcal{U}(s_t) = \{(0, -1), (0, 1), (1, 0), (-1, 0)\}$.
- 3. State transition function $s_{t+1}=f(s_t,u_t)$. For example, the up-down-left-right action can be combined as addition to get the next state $s_{t+1}=s_t+u_t$.
- 4. Initial State $\mathrm{s}_I \in \mathcal{S}$
- 5. Goal states $\mathrm{s}_G \subseteq \mathcal{S}$

A Graph

A graph $\mathcal{G}=\{\mathcal{V},\mathcal{E}\}$ is defined by a set of vertices \mathcal{V} and a set of edges \mathcal{E} such that each edge $e\in\mathcal{E}$ is formed by a pair of start and end vertices $e=(v_s,v_e),v_s\in\mathcal{V},v_e\in\mathcal{V}$. The first vertex is called the start of the edge $v_s=\operatorname{start}(e)$ and second vertex is called the end $v_e=\operatorname{end}(e)$.

A discrete planning problem can be converted into a graph by definiting

- 1. Vertices as the state space $\mathcal{V} = \mathcal{S}$.
- 2. The action space at each state as the edges connected to that vertex/state, $\mathcal{U}(s_t) = \{(s_t, s_j) \mid (s_t, s_j) \in \mathcal{E}\}.$
- 3. State transition function is the other end of th edge,

$$\mathbf{s}_{t+1} = f(\mathbf{s}_t, \mathbf{u}_t) = \mathrm{end}(\mathbf{u}_t)$$
, where $\mathbf{s}_t = \mathrm{start}(\mathbf{u}_t)$.

Representations of Graphs

Undirected graph

```
In [1]: # Programmatically you can represent a adjacency list as python lists
        # Python lists are not linked lists, they are arrays under the hood.
        G adjacency list = {
            1: [2, 5],
            2: [1, 5, 3, 4],
            3:[2,4],
            4: [2, 5, 3],
            5: [4, 1, 2]
        # Prefer to represent a matrix in python either as a list of lists or a nump
        import numpy as np
        G adjacency matrix = np.array([
            [0, 1, 0, 0, 1],
            [1, 0, 1, 1, 1],
            [0, 1, 0, 1, 0],
            [0, 1, 1, 0, 1],
            [1, 1, 0, 1, 0]
        ])
        # Edge list is another possible representation
        G edge list = [
            (1, 2), (1, 5),
            (2, 1), (2, 5), (2, 3), (2, 4),
            (3, 2), (3, 4),
            (4, 2), (4, 5), (4, 3),
            (5, 4), (5, 1), (5, 2)
        ]
```

Directed graph representation

```
[0, 0, 0, 0, 1, 1],
            [0, 1, 0, 0, 0, 0],
            [0, 0, 0, 1, 0, 0],
            [0, 0, 0, 0, 0, 1]
        ])
        # Edge list is another possible representation
        G_edge_list = [
            (1, 2), (1, 4),
            (2, 5),
            (3, 6), (3, 5),
            (4, 2),
            (5, 6)
In [3]: # Exercise 1
        # Write a function that converts a graph in adjacency list format to adjacen
        def adjacency list to matrix(G adj list):
            G adj mat = None # TODO: Write code to convert to adj mat
            return G_adj_mat
